

# Hotel Room Pricing in Indian Cities

Aman Gupta  
February 23, 2018

*Project Title - Hotel Room Pricing in Indian Cities*

*Name - Aman Gupta*

*Email - amangupta151299@gmail.com*

*College - IIT Kanpur*

## Introduction

In this project we will analyse the pricing strategy of hotels in the Indian hotel industry and effect of some factors on room rent. The objective of this project is to identify the factors that matter the most. For example, internal factors like free breakfast, free wi-fi and presence of a swimming pool may be responsible for increase in room rent but external factors like Star Rating of hotel and whether the city is metro city or not, will be more significant in determining the room rent.

## Overview

The specific objective of this study was to investigate the pricing strategy employed by hotels located in different cities of India. This study analyzed effect of different factors on room rent. By regression analysis, it is discovered that factors like StarRating, IsMetroCity, IsTouristDestination and IsNewYearEve are quite effective for room rent in hotels while factors like distance from airport do not have considerable effect on room rent.

## Data

For this study, we collected data from hotel website(<http://www.hotel.in/>). This dataset includes details of different hotels in 42 different cities in India. Data contains room rent of each hotel on different occasions, e.g., on a weekend, on a new year eve and on a normal working day. Also factors like distance from airport, star rating, hotel capacity, free wi-fi, free breakfast and swimming pool are clear in each row of data. Room rent also depends on city rank, whether the city is metro city/populated or not, whether city is a tourist destination or not. So all these details are available from dataset which makes our analysis more accurate and real.

## Read the data

```
hotel <- read.csv(paste("Cities42.csv", sep=""))  
View(hotel)
```

```
dim(hotel)
```

```
## [1] 13232 19
```

## Attach the dataframe

```
attach(hotel)
```

## Summarize the data

```
summary(hotel)
```

```

## T-tests

### RoomRent and IsMetroCity

H0: There is no significant difference between the Room Rent of Hotels in non-metro cities and metro cities. H1: Hotels in non-metro cities are more expensive than that in metro cities.

```
t.test(RoomRent~IsMetroCity,data=hotel)
```

```
##
## Welch Two Sample t-test
##
## data: RoomRent by IsMetroCity
## t = 10.721, df = 13224, p-value < 2.2e-16
## alternative hypothesis: true difference in means is not equal to 0
## 95 percent confidence interval:
## 888.0308 1285.4102
## sample estimates:
## mean in group 0 mean in group 1
## 5782.794 4696.073
```

Since  $p\text{-value} < 0.05$ , we reject the null hypothesis, hence, the Room Rents of Hotels in non-metro cities is more than that of metro cities.

### RoomRent and IsTouristDestination

H0: There is no significant difference between the Room Rent of Hotels in Tourist destinations and non tourist destinations. H1: The Room Rents of Hotels in Tourist destinations are greater than that in non tourist destinations

```
t.test(RoomRent~IsTouristDestination,data=hotel)
```

```
##
## Welch Two Sample t-test
##
## data: RoomRent by IsTouristDestination
## t = -19.449, df = 12888, p-value < 2.2e-16
## alternative hypothesis: true difference in means is not equal to 0
## 95 percent confidence interval:
## -2152.059 -1757.983
## sample estimates:
## mean in group 0 mean in group 1
## 4111.003 6066.024
```

Since  $p\text{-value} < 0.05$ , we reject the null hypothesis, hence, the Room Rents of Hotels in Tourist destinations are greater than that in non tourist destinations.

## RoomRent and IsNewYearEve

H0: There is no significant difference between the Room Rent of Hotels on normal Eve and New Year's Eve. H1: The Room Rents of Hotels on normal Eve are cheaper than that on New Year's Eve

```
t.test(RoomRent~IsNewYearEve,data=hotel)
```

```
##
## Welch Two Sample t-test
##
## data: RoomRent by IsNewYearEve
## t = -4.1793, df = 2065, p-value = 3.046e-05
## alternative hypothesis: true difference in means is not equal to 0
## 95 percent confidence interval:
## -1256.5297 -453.9099
## sample estimates:
## mean in group 0 mean in group 1
##      5367.606      6222.826
```

Since  $p\text{-value} < 0.05$ , we reject the null hypothesis, hence, the Room Rents of Hotels on normal Eve are cheaper than that on New Year's Eve.

## RoomRent and FreeBreakfast

H0: There is no significant difference between the Room Rent of Hotels with free breakfast and hotels without free breakfast. H1: There is a significant difference between the Room Rent of Hotels with free breakfast and hotels without free breakfast

```
t.test(RoomRent~FreeBreakfast,data=hotel)
```

```
##
## Welch Two Sample t-test
##
## data: RoomRent by FreeBreakfast
## t = 0.98095, df = 6212.3, p-value = 0.3267
## alternative hypothesis: true difference in means is not equal to 0
## 95 percent confidence interval:
## -153.5017 460.9935
## sample estimates:
## mean in group No mean in group Yes
##      5573.790      5420.044
```

Since  $p\text{-value} > 0.05$ , we accept  $H_0$ , hence, there is no significant difference between the Room Rent of Hotels with free breakfast and hotels without free breakfast.

## RoomRent and FreeWifi

$H_0$ :-There is no significant difference between the Room Rent of Hotels providing free wifi and those which do not  
 $H_1$ :-There is a significant difference between the Room Rent of Hotels providing free wifi and those which do not.

```
t.test(RoomRent ~ FreeWifi, data = hotel)
```

```
##  
## Welch Two Sample t-test  
##  
## data: RoomRent by FreeWifi  
## t = -0.76847, df = 1804.7, p-value = 0.4423  
## alternative hypothesis: true difference in means is not equal to 0  
## 95 percent confidence interval:  
## -360.5977 157.5701  
## sample estimates:  
## mean in group No mean in group Yes  
##      5380.004      5481.518
```

Since  $p\text{-value} > 0.05$ , we accept  $H_0$ , hence there is no significant difference between the Room Rent of Hotels providing free wifi and those which do not.

## Regression Analysis

### Consider the following Regression Model

$$\text{RoomRent} = \beta_0 + \beta_1 \text{StarRating} + \beta_2 \text{Airport} + \beta_3 \text{FreeWifi} + \beta_4 \text{FreeBreakfast} + \beta_5 \text{HotelCapacity} + \beta_6 \text{HasSwimmingPool} + \beta_7 \text{IsMetroCity} + \beta_8 \text{IsNewYearEve} + \beta_9 \text{IsTouristDestination}$$

```

"IsTouristDestination"))
```

## Conclusion

- Hence, the p-values and the coefficients suggest that the model is a good fit and the regression is good.
- Factors like StarRating, IsMetroCity, IsTouristDestination and IsNewYearEve affect RoomRent much much significantly.
- Factors like FreeWifi and FreeBreakfast have a very little effect on Roomrent as their confidence interval is closer to zero.
- Factors like Distance from Airport and Hotel Capacity are not statistically significant for RoomRent as their confidence interval includes zero.
